It's in a button. I actually imported the form twice from a two other databases that i use it in without any problems.

I have a form that I use in several databases. It lets the user select a starting and ending query from a listbox then it runs all the queries in between. There is a refresh button that loads the query list into a list box. I've included the query below that deletes all the queries from the [Query] table and repopulates the table so that any new queries show up. The  
it refreshed the query listbox. This works fine in several databases except one. I've checked and the references are identical.

## Re: Code works in several databases except one

It errors out on the line `Set dbs = Application.CurrentData` and says  
"Compile error: invalid outside procedure"

I can't figure out why it won't work in this one database.

```
Dim obj, dbs As Object
Dim SQLStr, QuerySource As String
Dim number As Integer
```

```
Set dbs = Application.CurrentData ' ***this is where the error message
pops
up ***
Set obj = dbs.AllQueries
```

```
number = 0
QuerySource = "INSERT into Queries (QueryList, QueryNumber) VALUES
("
```

```
DoCmd.SetWarnings 0
```

```
Delete = "DELETE Queries.* FROM Queries"
DoCmd.RunSQL Delete
```

```
For Each obj In dbs.AllQueries
QuerySource = QuerySource & obj.Name & ", " & number & ")"
SQLStr = QuerySource
DoCmd.RunSQL SQLStr
number = number + 1
QuerySource = "INSERT into Queries (QueryList, QueryNumber) VALUES
("
Next obj
lstQueryList.Requery
```

```
--
```

```
"Just because you don't know how to do something doesn't mean it can't
be
done"
```
