Has anyone else had issues with Access when you logoff local user and login to Active Directory?

System info:

Front end: Windows XP, Service Pack 2

Back end: SQL Server 2003

Access 2007

Event: I have been running quite successfully an application built with VBA and macros. I have had no problem running it until I had to move to Active Directory. The application stopped running my macros and it told me that "The database cannot be opened because the VBA project contained in it cannot be read." It threatened to delete "all code from modules, forms and reports..." Naturally, I told it not to do that.

When I login as local user, no problem. It likes me, I like it, we have fun together. But in A.D., you would think that it never knew me!

I have tried to tell Access that all of my work can be trusted, but I guess he doesn't believe me.

Can any one help!!
