Thank you for your help. It has been sooo long since I've had to do anything in SQL statement! It worked exactly like I wanted it to.

Thank you again for your help Jim Burke

After thinking about it, this will include all transactions past 60 days due in the number for past 30 days. Not sure if you would want that or not. If not then you would want to change the one for past 30 to be

```
Sum(IIf(Now()-[DateRequested]>=30 and Now()-[DateRequested]<=59 ,1,0)) AS  
Past30
```

JimBurke wrote:

From what I can gather, this form is bound to a table that consists of transactions, and you merely need to count the number of them as well as the ones 30 and 60 days past due. Is that the case? If so, you should just do it through a query. This should work if I'm right about what you're doing

```
SELECT Count(*) AS MyCount, _  
Sum(IIf(Now()-[DateRequested]>=30,1,0)) AS Past30, _  
Sum(IIf(Now()-[DateRequested]>=60,1,0)) AS Past60  
FROM yourTableName
```

I would just create a stored query from that SQL.

Then you can either open a recordset on that query and retrieve the values thru the recordset or else do DLookups:

```
transCount = DLookup("myCount","thatQueryName")  
past30 = DLookup("Past30","thatQueryName")  
past60 = DLookup("Past60","thatQueryName")
```

Re: Do While Loop code

I have a menu type form, and on it there is a spot to count how many outstanding transactions there are. What I am trying to do is get a total

[quoted text clipped – 28 lines]

```
txt60Days = Days60 & " are over 60 days old" 'txt60Days is  
field on form  
End Sub
```
