Josh,

I'd create a query that defines the number of months, and maybe even days, your tenant has been renting from you. What you'll need to use is a field that indicates the date the tennant started renting from you(I named it "date joined") and from there you can calculate the number of months the tennant has been with you. You can even go down to the number of days if you'd like.

Date () indicates current date.

Num\_months: Month(Date()-[date joined])

Save this query, then use the values defined in this query to multiply by the monthly rental rate for a total due YTD.

Hope this helps.
