My database contains expiration dates (of certificates) up to four years in the future. If the expiration date is during the current year, we need to request a new certificate. In that case I have made a query that flags everybody with a certificate that is due to expire in the next thirty days. I run the query about weekly. If the expiration date is not this year, we still need to obtain confirmation that the certificate is still in effect. I can construct (concatenate) an expression that combines the month and day from the expiration date field with the current year (if the certificate expires on 11/1/06, the review date is 11/1/04, and I would send out a reminder on 10/1/04). It looks right when I run the query, but I cannot filter it with the Between function:

Between Date() And DateAdd("m",1,Date())

This is a reworded reposting of an earlier question to which I received no replies.
