

microsoft.public.access.queries: Max # of fields in a query?

Max # of fields in a query?

How many fields are allowed in a query? When I tried to make a query which would include all fields in every table (to use as the basis of a group of forms), I got an error message "too many fields". I don't need all of these fields in any one form, but it's simpler to have only one query as the forms are being developed. I have plenty of RAM and disk space – can the number be configured to be larger?
