

microsoft.public.access.queries: finding records matching an approximate value

finding records matching an approximate value

I would like to search a pile of records with a field matching all the characters from a field in a form, but it doesn't have to be exact. for example the field on the form may be: "d86-934" and the field in the record could be: "00d86934"

Is this possible with something like this?

```
SELECT records FROM records
```

```
WHERE (((records.CONT_NO) Like
```

```
[Forms]![Select_SH_NUM]![ROAD_HIST_TBL2].[Form]![CONT_NUM]));
```

Any help is greatly appreciated.
