We are getting a system resources exceeded message on a query with a left join between a local table (left) and odbc linked table (SQL Server) on a machine running XP and Access 2003. When the join is changed to an inner join, the query runs successfully. The net result difference is 4 records. A machine running windows 2000 succesfully runs both queires. I have edited the MaxLocksPerfile in regedit and Buffer size. Any thoughts?
