I have a table which contains a loan type field, a 2 character text field, and the current loan balance. I ran a query on the data and it is summed by the loan balance so I have a total of the loan balances by loan type. How do I get it to compute percentages of currbalance for each loan type? This is a breeze in Excel, I figured has to be away to do it in access.

Type sumofcurrbalance %of total curr balance

CM 100,000 how do I compute this?

CR 100,000

CL 100,000

LE 100,000

Total 400,000
