I agree as well, in most cases, however, in this particular application the "names" will actually be unique numbers between 1 and 3 digits long. A pull-down option would end up being just a giant list, hundreds of numbers long.

Here's the SQL view of that query.

```
SELECT results.route
FROM results
WHERE (((results.route)=[Route:]))
ORDER BY results.route;
```

The table name is "results"

The field that is being queried on is "route"

Currently, the user is prompted to enter the Route name (which is actually a number) they want to see all records for. However, they can only enter 1 route at a time.

They need to be able to enter 1 or More routes and have the query show all entered. Separating each by a comma will not be a problem. Since route "names" are actually numbers, the chance of entry errors will hopefully be reduced..

Re: Enter MULTIPLE Items in a Query (e.g. [Name:] ??

Thanks
