Check out Allen Browne's "bug" about Name AutoCorrect.

<http://allenbrowne.com/bug-03.html>

A query not prompting you about saving it is one of the symptoms of this "tiny", irritating bug.

Hi Don,

I've never seen this behavior. Just today I create a new query in A03 and was prompted to save after closing. Then I modified another query and was also prompted to save it.

If a program does something that is not expected; is intermittent; and no reasonable explanation, I think that fits the definition of a bug.

Hi Jerry,

I have been researching this thread topic in both the general access and access.queries groups. Although your logic seems correct, I have had this problem show up in multiple databases and I never have used the SetWarnings

Re: changed queries save automatically

command and always have the option "Confirm Action Queries" checked on.  
In fact, when I observe this behavior I have checked the "Confirm Action Queries" and it still shows checked on.

Either something else is turning off warnings or we're dealing with a bug (that wouldn't be a first). BTW – I never experienced this before  
Access 2003 and have used Access since Office 95.

Any more thoughts?

Don Small

Yes I have and it's not what you think such as corruption.  
Most likely  
in  
a  
macro or code someone has Set Warnings to Off but forgot  
to Set  
Warnings  
back  
on when finished. Often people turn the warnings off when  
doing  
something  
like automatically appending a lot of data or deleting records  
so that  
they  
don't get bugged with all the "do you really want to"  
messages.

Compacting and repairing closes the database and reopens it.  
By default  
when  
the database opens, Set Warning is on until someone turns it  
off. You  
might  
even have something running from the startup form or the  
autoexec macro  
that  
turns off the warnings.

If I'm right (it's been known to happen) about the time that  
your  
changed  
queries save without asking, you'll also find that changed

Re: changed queries save automatically

forms and  
reports  
will do the same thing. Even closing the database and  
reopening should  
fix  
it  
unless it's a startup form or autoexec macro kicking in.

I am working in Access 2003 SP2 and I have  
to continually Compact and  
Repair  
the database, because I do not always get the  
popup asking if I want  
to  
save  
a changed query. I like to open an existing  
query and do a "What If"  
change,  
but don't want to have that change saved  
when I close the query.  
Sometimes I  
can work in the database for a while before it  
saves changes  
automatically.  
Has anyone else run into this problem.
