Some bugs are difficult to fix because they will break other things when fixed.... MS is very aware of this bug, and it's been looked at in many ways... I think the new ACCESS 2007 version will show some improvements, but one never knows until it's released.

Good grief! Not exactly a "tiny" bug is it?

Thanks Ken – this is great advice and very likely what is causing this and other problems. Leave it to Microsoft to have so many known bugs that aren't fixed... It's very unprofessional of Microsoft to leave known issues uncorrected if you ask me.

Thanks again to you and Jerry for your help. I just joined MS Usergroups yesterday and am very please with this excellent community forum.

Don

Check out Allen Browne's "bug" about Name AutoCorrect.
<http://allenbrowne.com/bug-03.html>

A query not prompting you about saving it is one of the symptoms of this "tiny", irritating bug.

Hi Don,

I've never seen this behavior. Just today I create a new query in A03 and was prompted to save after closing. Then I modified another query and was also prompted to save it.

If a program does something that is not expected; is intermittent; and no reasonable explanation, I think that fits the definition of a bug.

Hi Jerry,

I have been researching this thread topic in both the general access and access.queries groups. Although your logic seems correct, I have had this problem show up in multiple databases and I never have used the SetWarnings command and always have the option "Confirm Action Queries" checked on. In fact, when I observe this behavior I have checked the "Confirm Action Queries" and it still shows checked on.

Either something else is turning off warnings or we're dealing with a bug

Re: changed queries save automatically

(that wouldn't be a first). BTW – I never experienced this before

Access

2003 and have used Access since Office 95.

Any more thoughts?

Yes I have and it's not what you think such as corruption. Most likely in a macro or code someone has Set Warnings to Off but forgot to Set Warnings back on when finished. Often people turn the warnings off when doing something like automatically appending a lot of data or deleting records so that they don't get bugged with all the "do you really want to" messages.

Compacting and repairing closes the database and reopens it. By default when the database opens, Set Warning is on until someone turns it off. You might even have something running from the startup form or the autoexec

Re: changed queries save automatically

macro
that
turns off the warnings.

If I'm right (it's been known
to happen) about the time
that your
changed
queries save without asking,
you'll also find that changed
forms and
reports
will do the same thing. Even
closing the database and
reopening
should fix
it
unless it's a startup form or
autoexec macro kicking in.
