Create a main report of just each unique Provider (no members). Then create a multi-column subreport that is based on the Provider and Member records. Set the subreport to display across then down. Add the subreport to the detail section of the main report and set the Link Master/Child properties to Provider.

Hopefully, someone can help me with the design of the way a table looks from a query.

Lets say I have a table that has 10 rows of member and provider information in it. However, there are ONLY 5 doctors. Some of the doctors have more than 1 patient, so they have more lines. IE –  
PROVIDER MEMBER  
dr. jones mary  
dr. jones james  
dr. jones sam  
dr. adams eddie  
dr. jay amy  
dr. jay sally  
dr. peace jake  
dr. steph kenny

What I need to do is produce a report with only 5 total lines (equal to the amount of doctors) with columns for each member.....IE  
PROVIDER MEMBER1 MEMBER2 MEMBER3  
jones mary james sam  
adams eddie (blank) (blank)  
jay amy sally  
(blank)

Re: query design issue

steph kenny (blank)  
(blank)

Can anyone help me write a query for this procedure.....I must have the columns as each member must stay int he same line as the provider they use.

I really appreciate it!!!!
