I had no clue you could define parameters using the popup menu. I don't think I ever learned that in any class I ever took. But that appears to have worked for me. Thanks for your help.

Doesn't matter.

Your third query (in SQL view) should look something like:

```
PARAMETERS [Enter a starting date] DateTime;  
SELECT * FROM qry2;
```

If you have more than one parameter, just separate them by commas. Do you know how to define parameters in the query grid?

If not,

1. open the query in design mode.
2. right click in the grey area next to the box that displays qry2 and the fields that are in it
3. Select Parameters from the popup menu
4. In the Parameter column, enter your parameter, exactly the way it used

Re: Filter by sum of counts

in your query. In your case, it will look like:

[Enter a starting date]

5. In the DataType column, enter Date/Time

I would, but the third query doesn't have the date field available to it, since it's not a displayed field in the other two queries.

Add the same parameters clause that you have in the other query to the beginning of the 3rd query.

That's OK. Yes, his solution worked for me, but now I have another question/problem. In my underlying table, I have a

Re: Filter by sum of counts

date field. I figured out that by putting a parameter asking for a starting date and ending date into the first two queries, that I can limit my results to just the dates that are inputted by the user. However, when I try to create a chart based on the third query, it states that the Microsoft Jet database engine does not recognize '[Enter a starting date]' as a valid field name or expression. I know this is because the third query does not contain the parameter input, but I don't know how to get around that. Any suggestions?
