

Late Binding

I have an Access db developed with Access 2003 that will work (with adjustments to references) with 2002 and 2000. Presumably it will also work with Office 2007.

So far I've manually adjusted references for each machine I install it on. I'm told that I should look into late binding. I've found some discussions on how to do this with Excel and Outlook. It looks like I change the way I call these by changing as object to application or vice versa where I call them.

I'm pretty sure that I've had to change some of the other references as well and I don't know if I can use late bindings with the others or how.

The references I use are:

- Visual Basic for Applications
- Microsoft Access 11.0 Object Library
- Microsoft DAO 2.5/3.51 Compatibility Library
- OLE Automation
- Microsoft ActiveX Data Objects 2.7 Library
- Microsoft Excel 11.0 Object Library
- Microsoft Outlook 11.0 Object Library

Can someone help me with this? I saw another post that says to look at the MVP site, but, I haven't been able to locate it.

Thanks

.
