No: you can't do that John. A parameter can only be a value; it cannot be a mix of various values, separators, operators, ...

You could get the report you want by building a WhereCondition string to filter the report. Here's an example:

Use a multi-select list box to filter a report

I know how to create a parameter query. What I'd like to do is run a parameter query that displays many child records of one parent record that permits multiple parameter entries for the primary key. Can this be done?

For example, the query returns:

ID (pk)
12345
12346
12347
12348
12349

I may only want the report to display:

12345
12348
12349

I can't see how this could be done via a parameter query.

Re: parameter query

Does anyone have any ideas? Thanks in advance!
