I have replicas that I want to move to another machine and am uncertain how to do this. Here is my configuration. I have the master and a full replica on machine A (the server). I have two partial replicas that use indirect replication over the internet each on machines B & C that replicate back to the full replica on A. The replicas on B & C were created from the full replica on A. This configuration has been in place for over a year and works fine.

I want to move the master and the replica on machine A to another machine (A2) that is not on my LAN. Can I use move replica on the Replication Manager and move the master and full on machine A to a CD and then place the CD in machine A2 and move to a new folder on A2?

Thanks.

IC
