I tried your suggestion and the "Conflict Viewer" still does not pop up, therefore making it impossible to resolve the conflicts. However, I noticed in my Tables, there were new table names, such as Owner_Conflict. Is it possible to resolve using these tables? It only shows the fields from one database so I cannot determine which field is having the conflict.

One last thing: have you tried running the standalone conflict resolver? This should be in your [program files]\common files\microsoft shared\Database Replication folder (where [program files] is usually c:\program files). The wizard can be run directly from there, and then you point it at the replica you want to test for conflicts and it may be able to load them and allow you to resolve them.
