Hi! I posted this yesterday and now I can't find it in any of the topics. I also can't remember what I titled it but I believe it had something to do with ulcers.

I have a database that is collecting evaluations. I wanted to create a report that looked for records from a specific course, semester and year. The query is fine and the results are fine except I was unhappy with the formatting (i.e., an individual respondent's comments for all questions are in one glob, then the next, etc.). I wanted each type of comment (a single field) to be printed/displayed in a single section. So I came up with the idea of using subreports that would gather the data from the original parameter query.

The problem is that each subreport now requires entry of the criteria every time. That's 24 separate data entries to get each report. I created a form for the entry, thinking this would solve the problem but noooooo...

Any help would be greatly appreciated!

.
