In the 3rd argument (criteria) of the DLookup I posted:

```
"[DeptNo] = " & [DeptNoParam]
```

[DeptNo] is the Field name in the Table.

[DeptNoParam] is the name of the Parameter in the Query.

If both names are "DeptID", then change the criteria argument to:

```
"[DeptID] = " & [DeptID]
```

Access will recognise the first [DeptID] is supposed to be from the Table, i.e. Field name and the second [DeptID] is a value external from the Table / Domain "tblDepartment".
