Al Camp wrote:

Jack,
Not sure about "elegance" but this works...
Let's say you have a report called rptTest.
Create a table called PrintCount with 2 fields, ReportName/Text/NopDupes
and PrintCount/Num/Integer
Populate the table with this data...
ReportName PrintCount
rptTest 0

Use the report Open event to run this code...

```
Private Sub Report_Open(Cancel As Integer)
DoCmd.SetWarnings False
DoCmd.RunSQL "UPDATE tblPrintCount SET tblPrintCount.PrintCount =
NZ([PrintCount])+1 " & _
"WHERE (((tblPrintCount.ReportName)='rptTest'));"
DoCmd.SetWarnings True
End Sub
```

Be aware, that PrintPreview also constitutes a "print" and increments the counter. If you have the report "hardwired" to always print directly to a printer (with no PrintPreview), then this should work pretty well.

I can not figure out how to know the number of times the report has been printed whenever somebody print the same report.

Jack

Thanks for the assistance, Al Camp. However, I do not know how to use the programming code. How to open the program code and do I just copy and paste

Re: Help on subreport

the code that you gave me. Thanks.
