Sorry there was a typo in my re-typing of the error message. The error message did say <<Expr>>.

I changed the name of the field I added and tried to rerun the report but got the same error. The query runs and provides the correct data with no error.

Thanks!
Jennifer

Hi Jennifer,

Expr1 is what Access will assign for the first calculated field in a recordset... I suspect that

Ex[r

needs to change to Expr

You either have a bad reference in your code, a calculated field in the report, or the query that the report is based on.

I would check the query first -- look at the calculated fields. You can, by the way, change Expr1 to be something more logical... anything before the colon in a query will be the fieldname that the report uses. Avoid spaces and special characters (except underscore) in names.

To check your code:

go to the design view of any module:

'~~~~~ Compile ~~~~~'

Whenever you change code or references, you should always compile

Re: Error Message when running report

before executing.

from the menu in a module window: Debug, Compile

fix any errors on the yellow highlighted lines

keep compiling until nothing happens (this is good!)

'~~~~

if you didn't find it yet, we can give you more things to check

Warm Regards,

Crystal

Jennifer Nadey wrote:

I have a report, which runs off a query, which runs off a table. I

added a

column of data to the table and then that column to the query. I went

into

the report via Design View and added a text box to display the value of

the

new column. When I try to run the report, I get the following error message:

"The expression On Format you entered as the event property setting

produced

the following error: The object doesn't contain the Automation object '<<Ex[r]>>!'.

* The expression may not result in the name of a macro, the name of a user-defined function, or [Event Procedure].

*There may have been an error evaluating the function, event, or macro."

Re: Error Message when running report

Any thoughts on how I can fix this error?

Thanks,
