Hello. I am hoping someone out there can help me. I track homicide data and run reports for police administrators when they request it. I have data from 2005 and 2006. I want to be able to give them the count of homicides by district to-date. So, today's report would give a count of 2005 homicides by district from 1/1/05 to 8/28/05 and also of 2006 homicides by district from 1/1/06 to 8/28/06. I know I could run separate queries and enter the current date each time, but I would like to have a query that I can just run and it calculates it by the current date automatically. Is there any way to do this? Thank you for your help in advance!
