I have a program which basically loops through a table and produces custom reports for a series of 70 managers. I am producing them in .snp format. I would like to use your code to take the snp files and convert them to pdf so that the managers can read them. I have a report with a series of sub reports and the rtf output does not retain the original format.

I used your program on one of the files I had produced in test and it worked very well. I guess I would rephrase my question to : How do I incorporate the portion of the code which converts the snp to pdf? I am listing the code I produced at the end of this message. I would like to think I can include it somewhere in my loop.

```
Private Sub cmdOpen_Click()
```

```
Dim strDocName As String  
Dim strWhere As String  
Dim strWhereApp As String  
Dim strSQL As String  
Dim strApprover As String  
Dim rs As Recordset  
Dim db As Database  
Dim strSnap As String
```

```
strDocName = "rptSoxJuly"  
'strApprover = "Keith Gustely"  
Dim qdf As QueryDef  
Set qdf = DBEngine(0)(0).QueryDefs("rptSOXJuly")  
Set db = CurrentDb()  
Set rs = db.OpenRecordset("DistinctApprover", DB_OPEN_TABLE)  
rs.MoveFirst
```

```
Do While Not rs.EOF
```

```
With qdf  
strApprover = rs.Fields("AppName").Value  
strWhereApp = "Where Approvers.AppName = " & """" &
```

Re: Snapshot to pdf code

```
rs.Fields("AppName").Value & ""

'strWhere = "Approvers.AppName =" & strWhereApp
strSQL = "SELECT AS400CSTCTR.*, Approvers.AdminApproverName,
Approvers.AppName FROM AS400CSTCTR INNER JOIN Approvers ON
AS400CSTCTR.dspSysCostCenter=Approvers.CSTCTR " & strWhereApp

'.SQL = "SELECT AS400CSTCTR.*, Approvers.AdminApproverName,
Approvers.AppName FROM AS400CSTCTR INNER JOIN Approvers ON
AS400CSTCTR.dspSysCostCenter=Approvers.CSTCTR WHERE ((Approvers.AppName) =
(strApprover))"
.SQL = strSQL
DoCmd.OpenReport strDocName, acViewPreview
DoCmd.OutputTo acOutputReport, , acFormatSNP, "c:\windows\SOXReports\" &
strApprover & ".snp"
strSnap = "c:\windows\SOXReports\" & strApprover & ".snp"
DoCmd.Close acReport, "rptSOXJuly", acSaveNo
End With
rs.MoveNext
Loop
End Sub
```

I do not understand your question. Are you referring to the ReportToPDF solution? It creates a temporary Snapshot file which it deletes at the end of the process. The end user does not have to convert their reports to Snapshot format.

I downloaded the zip file and looked at the code. I have code attached to a form that creates the 70 reports I need based on a table. I want to incorporate this code to take the file in snapshot and convert it to pdf right away. If possible, I would like to save that file in a different folder so that I don't have two files with the same name (different
