Maybe a problem with the schema (also known as the owner) of the stored procedure. Did you use dbo. when creating this SP and set the Record Source Qualifier to dbo or if you have used something else for the schema (owner) of the SP?

Also, the newsgroup for ADP is m.p.access.adp.sqlserver .

I have an Access application that produces various reports. One of them is a summary report which obtains data from a large stored procedure containing many functions. When I pass the .adp/.ade file to a user, this one stored procedure disappears and the user is unable to run the report; however, I can run it from my machine or from hers when I remote in. Do I need to cut this stored procedure up into several smaller ones, or is there a better way to get the application to the user?

Thanks in advance.
