The date in the underlying table is formatted as date/time, short date. I'm assuming this is what you are talking about. I'm unaware of any field formatting within a query. As far as American formatting, I'm assuming that you mean the date is being entered as 7/01/07, which is the way I'm doing it.

This is a saved query "qryIfta" This query is the record source for the report & the report only serves as a vehicle to display the results of the query.
BTW...I don't know if it makes a difference, but I'm using Access 2000.

I would save the sql as a saved query and then open the form to enter date values. Then display the results in the query to see if it looks good. Are you using actual date data types and using American format?

I have a dialog form in which I enter the dates for the report. An okay button sets the form's visible property to false and opens the report. The query then gets it's criteria from the form. However, if I open the query and supply the correct dates, it still returns all records. The only change made to the query since last quarter when all worked fine was to change the date criteria prompt to pull these from the form. Here si the SQL for the query:

```
SELECT Sum(tblTripDetails.Gallons) AS SumOfGallons,  
Sum(tblTripDetails.LegMiles) AS SumOfLegMiles,  
tblTripDetails.StateMiles  
FROM tblTrips INNER JOIN tblTripDetails ON tblTrips.TripID =  
tblTripDetails.TripID  
WHERE (((tblTrips.TripDate)>=[Forms]![frmReportParameters]![StartDate])
```

RE: Report/Query not selecting specific records

Or

```
(tblTrips.TripDate)<=[Forms]![frmReportParameters]![EndDate]))  
GROUP BY tblTripDetails.StateMiles  
ORDER BY tblTripDetails.StateMiles;  
Thanks for your help.
```

Can you share how you are using the date entries to filter the report? This might require you to provide either the code that opens the report or the report's record source SQL view.

I have a database for tracking miles traveled and fuel purchased in each state. I have a report based on a query to total miles and gallons for each state in a quarter. Last quarter, the report worked perfectly. This quarter, for some reason, it's bringing in all records that have ever been entered instead of just the previous quarter's records. The only difference is that I changed the way the report opens. It used to require entering the beginning and ending dates multiple time. So, I created a form from which to pull the starting and ending date. I have opened the query on which the report is based and from there, input the dates in three different formats: 7/01, 7/01/07, 7/01/2007, etc, and it is still pulling all records. Please give me an idea on how to fix this!! I have a deadline on doing my quarterly reports & I don't want to have to think about figuring all of this manually. That will take till next year this time!! Thank you for sharing your wisdom!
