No, file permission in fact!

I can share the folder, that's not the problem.

But there a different db files in that folder and I don't want that ALL the users that have access to the folder also have access to ALL the files. I therefore want to use file permission, which wouldn't be a problem if it weren't that some of these databases are also used in an ASP web application. And I want to know which generic user (I thought it was INET_servername but that didn't work) is responsible for the 'ASP permissions' so to speak. Because I need to add that generic user to avoid the 'file is locked or doesn't have the permission to access' error ...

Did that make it anymore clear?
