Tim,

I already have linked tables and I am able to login as well. My question is how can I capture user credential.

Example: I login as 'Tina/pwd'

I would like to use the username 'Tina' in my query how can I use it. Like some packages have something like \$username this will retrieve the name of the user who is logged on.

Hope this is clear now.

Thanks for your reply!

-Tina

used ODBC links to get the necessary tables. These ODBC
links were set up from Control Panel/Administrative
Tools/Data Sources. These links used the SQL server's
security when you pull data into Access. But Access only
prompted me once when i started using the database, and it
allowed my continuous "access" to the linked data from
that point on, as long as i did not leave Access.
However, the next time I opened this database and wanted
to pull data again, i would log in again.
