To use their login and compare it to table entries, you'd use the `CurrentUser()` function.

To log their activities, you'd have to create code. This could be as simple or as complex as you need.

Access does not track user activity in any way.

Hi: Access 2000

A couple of questions:

1. How do I link a user's log credentials to a table/query. I want to be able to match their log in ID which is their employee id with their corresponding names in a table or query?
2. I also want to be able to track their activities while they are in the database. Does MSAccess create a log to record these changes?

Thanks

Bill
