Hello,

Currently, I'm using a database (Access XP) that is located on a network and Shared by other users. I recently copied the database from the network and Pasted it on my desktop. Next, I used the security wizard to create user Accounts with different rights. My problem occurs when I attempt to open the database. Once I login as a user and then close the database, and when I reopen the database, I don't see an option to change the user login and password. It takes me to my last login account. Any idea?? I haven't tried to put the database back on the network yet. It's sitting on the desktop. Could that be the problem?? And yes, I did look at some of the reports by Microsoft. Again, to clarify the question, I want to be able to see the login prompt every time I open the database. That way it will let me select a different user. Thanks.

John
