Yes they do, confirmed by my IT department, they also checked there was sufficient space on the drive as well – this is why they thought it was an access problem & not a network one. However, we still have occasional problems with other applications such as Excel when saving to the network drive – S drive can't be found ! & this is why I'm not 100% convinced it's an application problem

The first thing to check is whether or not ALL users have full permissions to the folder where the database resides.

I have a split database with security (all files on network drive) – two 'types' of user – User (with Read Access), and Administrator (Read/Write/Delete/Create). The database is accessed via icons on desktop (7 in total). I'm getting the following intermittent error messages  
Double click icon – opens access then displays access error message 'Microsoft Access couldn't find file 'S:\Cervscr\Databases\Secured.mdw'.  
This file is required for startup' where S = network drive.  
If I open the mdb file either from the File open menu or via explorer and double clicking on the file Access displays error message ' you do not have

Re: access or network problem ?

the necessary permissions to use the 'S:\Cervscr\Databases\QARC  
Contact.mdb'  
object. Have your system administrator or the person who created the  
object  
establish the appropriate permissions for you'.  
However by repeatedly attempting to access via the icon will usually  
result  
in success with a prompt for the password. I have contacted our IT  
department  
who believes its an access not a network problem – I'm not 100% convinced  
as  
there has previously not been any problems. Final piece of info that may  
help. This error message appears on all 7 PC's (different network  
accounts),  
if an administrator manages to open file, and somebody else enters their  
password (both user & administrator) then the following error message  
appears  
– The database has been placed in a state by user 'Administrator' on  
machine  
'HP14562106531' that prevents it from being opened or locked'

Any suggestions ?

Mike
