Thanks for the response. Yes they are using the same workgroup file. I've even changed the owner of my start up form to be the group that these guys belong to.

I've made shortcuts for both Access2002 and 2003 since 2002's access.exe is in office10 and 2003 in office11. Both shortcuts use the same /wrkgrp switch and path is exactly the same to the wrkgrp.

The original unsecured db was in 2000 file format and I notice that the mdw is also 2000 format. I wouldn't think this would be an issue but it's possible I guess.

The thing I find interesting is that the any user who has Access 2003 installed on their machine can go to a machine with Access 2002 on it and log in successfully.

This would indicate that the issue is related to 2003. Any other thoughts or suggestions??? Thanks

You could try converting your MDW to 2002/2003 format (a separate copy of course) and then see if the users with 2003 can use that.
