Just to clarify.

While that will limit who can access the database, it won't control what they can do within the database if they can access it.

There's no equivalent to "Trusted Connection" in Access: you must create a UserName, and the user must log on with that user name and password in order to use Access User-Level Security. However, depending on what restrictions are desired in terms of permissions for those who can access the database field, you might check what Joan Wild has at <http://www.jmwild.com/SecureNoLogin.htm>

Of course. Speak to your Network Administrator about providing a secure network share that only some users have access too. Put the data file in that location.

Am I able to set user permissions to my database using the windows login name. I want to restrict some access to the database but don't want to

have

users entering a password everytime they want use it?
