Hi All,

I have success fully created a login script for Access 2003, but the information that i am looking for is that

1. To give admin & user access

-- User = read / write (should not be able to delete or update information on the d-base)

-- Admin = complete access

I am aware that i can create security settings on tools -> Security!! but i dont want that to happen!!

The settings need to be got on the form (login information its-self) table created

2. The user name should be displayed on the form (main) and should be stored in the table!

.
