Hi Bonnie,

Good point... I hadn't thought of checking their user rights, I don't believe they were added to the server/directory/file rights, I just added them to the ACCESS Secure Database with permissions... I will check that on monday with My Server Administrator... Nope, this isn't a split database... I am looking into maybe doing this, however I am a little apprehensive, because I have heard there are sometime issues when trying to split an already secured mdb file... I have over 18 users with the shortcut already on their database, and are all able to get in with no problem, however what do you recommend? I am always open to new and better possibilities... This will be a database used daily by the users 7 days a week.... and I will be running reports on a daily, weekly, and monthly basis... thanks for your help, U R awesome.... Tbooker

Check your user's rights on the server/directory – read/write/delete. Are they all working off the same server with the same rights? Is your application split with front end/back end? What version of Access, what network operating system, what desktop operating systems?

Hi Bonnie – I didn't see anything different – the start in and target links are correct.... I have 18 users all working fine, and only 2 users with this

[quoted text clipped – 7 lines]

or something... Because no other users seem to have this issue... Any suggestions?
