G'day John,

Have a look at the permissions on the server mdb file that you are trying to link to.

You will need the folder to be shared with permissions and to have security permissions on the folder. The file should inherit the permissions but we have recently found that access will shed permissions if you open it to make design changes. We have not found a way around this except to manually check and re set up the permissions. And do not believe it is a very desirable behaviour.
