I need to design a database for services request

I have designed a table which contain two date date columns and time columns  
and two forms

One for recording the user request date and time automatically

One for recording the view date and time of technical staff automatically

User request form will generate Ref No and request date and time  
automatically

Tech form will search the request by Ref No and update the view date and  
time after click save or update(but I cant)

Please teach me

there is also a field I want to protect with password from change after  
keyin the value

How the process ?

Is this possible for access to provide a calendar for date choosing?  
if yes , how to

new comers. Please advise in detail

Much Thx

Michael
