I figured out the solution to my problem and I thought I would post it in case anybody else has the same problem. Tim & Jeff seemed to be so interested in my application (which was running perfectly) that they couldn't listen to the problem I was having. The problem I had concatenating the Number (converted to a string) to the end of a constant strFileName was that the function Str() adds a space for the sign of the number which when concatenated to the constant and included in the 'Create Table' SQL statement must have put a character that the strSQL couldn't accept so I would get a syntax error although everything seemed correct. . So, after I made the Number a string I then took the sign away by using Mid(Str(Number),2) and it returned ONLY the number part so I could create the tables called Quilt1, Quilt2, Quilt3, etc. In order for this to make sense I think you would have to go back and read the rest of the threads. I hope this helps someone.
Thanx
