Depending on the number of registrations per event, I would try create two list boxes on the event form. The first would allow you to select a single EventsLocation record. The second list box would be multi-select of the Attendees registered for the Event. Users could select an event and multiple attendees then click a button to append records to the Attendance table.

You could add other functionality to display current attendees or just show them in a subform linked to the event and the selected EventsLocation.

I am attempting to set up an attendance database:

the tables I have are:

Attendees

=====

AttendeeID (PK) 1:n with Registration

1:n with Attendance

Demographic data

e.g firstname, surname etc.

Events

=====

EventID (PK) 1:n with Registration

Eventname

Spaces etc.

Registration

=====

RegistrationID(PK)

AttendeeID

EventID

Re: Attendance database ?relationship problems

RegFee etc

These three table I think are OK the events database works how I want with these table. the remaining tables to add attendance are:

EventsLocation

=====

ID(PK) 1:n with attendance

EventID

DayNo.

Numberofdays

Dateofday

venueam

venuepm

Attendance

=====

AttendanceID (PK)

AttendeeID

ID

AttendanceDate

Attended (Y/N)

this is where I am stuck, I would like to have a form open from my events form, which would have a list of each person on the course with each date and tick boxes

e.g

12/6/06 13/6/06 14/6/06

Michael Mouse

I cannot think of a way to get data into the table, I have tried queries but when I add the attendance table I get no records back (probably because there are no records in the table)

I am stuck and need help

hope someone can help

Thanks

Phil
