OH we will need to get rid of the other code you are not using so you can make a new db and just put this in or if this is the only code get rid of the rest and then go to the debug tab and press compile. We could be getting errors from the other code.

We haven't hooked up the button yet we will do this in steps. do you know how to use debug menu? in code window using the view/menu/debug selection will place the debug menu at the top. and if you hover over the selection with the writing and the arrow it will say "step into". when you click it it will step through the code. so palce the cursor on the call newtest line and start stepping. When you get to the Documents.Open FileName:=defaultDir & "TEST.DOC" line and click it should open the document. Ok.

Susan H. White wrote:

Lewie, I created a second module for Public Sub newtest() as you directed. Again triple checked. Included each line except your"OK this will open a test document . . ." and "this will run it, etc. . . ." Created a test.doc file in C drive and tested that by the Run process. Then I created a test.doc pathway in my list box. Then held my breath and pushed the button and . . . nothing! Went back to step through the module and I get right away "Compile Error, variable not defined." Susan

"lewie" wrote:

```
Public Sub newtest()
```

```
defaultDir = "C:\"  
'Options.DefaultFilePath(wdDocumentsPath)  
defaultDir = defaultDir + "Test.doc"  
With Application.FileSearch
```

Re: Getting from Access to Word

```
.FileName = "Test.doc"  
.LookIn = defaultDir  
.Execute  
If .FoundFiles.Count = 1 Then  
Documents.Open FileName:=defaultDir & "TEST.DOC"  
Else  
MsgBox "Test.doc file was not found"  
End If  
End With  
End Sub  
ok this will open a text doc named test.doc in c: drive  
Public Function x()  
Call newtest  
End Function  
this will run it  
then when this is working all we have to do is assign what is  
in the  
dropdown to these values  
put this code in module and step thru it.  
using the debug bar.
```

In a form, I have a listbox
based on a table that
contains Section,
Subsection, Page and
Pathway. What I want to
have happen is that selecting
one of the lines in the
listbox automatically
activates the Pathway so
that
the specified document
comes up in WORD.

I'm just unable to do this,
despite hours of frustration
with macros,
coding, etc. Can anyone
help?

What code are you using now? I would
expect something like...

Re: Getting from Access to Word

Application.FollowHyperLink
Me.ListBoxName.Column(3)
