Hello,

Im designing a database for people responsible for applications at my work. We have three groups, ApplicationOwner, ApplicationOwnerIT, ChangeControlContact.

I want all the contacts in one table and linking to the application table as the appropriate people. I set a join from contacts to the three application table and it would only force it to one of the groups not all three. I then created three tables with only one field in each, ID field to act as a passthrough table from contacts to applications but thats not working either, I have set joins on all of them.

Appreciate any help.

.
