I have a field called [Franking] that has had a validation rule applied via the table-design interface.

The rule is ">=0 And <=1".

I now need to change this rule programatically (ie using DDL) to ">=0 And <=4"

(I can't use the table-design interface because I need to change clients databases via a script).

I suspect I need to use ALTER TABLE with (possibly) ADD CONSTRAINT. However all examples I find require a DROP CONSTRAINT first – but what is the name of the current constraint?

Is it possible to do this, and if so , how?

Any help much appreciated.

Alister
