Hi,

I'm working on a database and while I think I know what I want to I cant quiet get the thing to work.

My db will be used by project managers to record monthly spend and resource/project assignments. There will be multiple projects and both project managers and resources will be working on more than one project.

The data that I currently have is:

Project Manager Details:

Manager Name  
-----

Project Details:

Project Name  
Project Code – pk  
Grouping  
Approved Budget  
Approved Capital expenditure  
Approved Revenue Expenditure  
-----

Resource Details:

Resource name – pk  
Resource Category  
Monthly days worked against each project  
-----

Capital Expenditure:

Jan–Feb (monthly amount)  
-----

Revenue Expenditure:

## Unsure how to link tables

Jan–Feb (monthly amount)

---

At the moment I have a table for PM names, a table for resource name & category, tables for monthly capex and monthly revex, a table for project details and a table for monthly days for each resource against a project.

What I want in an ideal world is for a form to display the following:

Project Manager Name

---

A sub form for all the projects linked to the PM in it.  
This will display project name, code, grouping, approved budget, revenue & Capital

---

Another subform with all the resources linked to the particular project.  
this will display the resource name, category and days worked for each month against that project.

---

A sub form to input monthly revenue expenditure against that project

---

A subform to input monththly capital expendture against the project

---

I've marked the unique records with pk, any help with this is much appreciated.
