Just when I thought I had it solved!

Previously I found that decreasing the compression on the virtual web server allowed for the proper display of the OWA screen on a client's PC. (Please, see my previous two threads in this forum for the symptoms.) Since he got home from the cottage, and started using his home PC, he found that that previous fix, while it worked fine on the PC at his cottage, did not resolve the same issue on his home PCs.

I have since found that, although the issue was resolved on my Toshiba laptop, it did not resolve the issue on my desktop. I tried to install IE6 SP1 overtop of the current IE6 SP1 installation, in case some files need updating, but Microsoft's "intelligent" installer won't let me. I guess they figure they can tell from a single version file how well my installation is working!

I am posting here in case Marino (who has been following this problem with me) has any other suggestions. We talked about applying SP1 to the Exchange 2003 on this SBS server, but I want to know before I schedule some downtime on this 24 X 6 business if there are actual fixes to this issue before I spend the time to install it and accomplish nothing.

I will post a similar post in the IE6 forum, to see if anyone there can tell me how to do a complete reinstall and update of the IE6 on an XP system.

Thanks.
