Hi, we have an SBS2k3 (premium) server. Recently we have had troubles with strange messages appearing in the outbound queue. They appear to be sent from 'postmaster@our domain name.com', they are directed to various email addresses none of which are known to anyone at our site, and are certainly not work related.

I clear the queue....and lo and behold, after a while they re-appear. I have checked and we are not on open relay. We have a hardware firewall and ISA and are running dual NIC. We have up to date Panda AV.....any ideas.....

TIA

Terry
