Hi,

I operate a Microsoft Windows Small Business Server 2003 Standard Edition with SBS Service Pack 1 and Exchange Server 2003 Service Pack 2.

The server has been recently installed and everything seems to work right (e.g. no errors in the event log). But on the Microsoft Windows Update site, only updates for the core operating system (Microsoft Windows Server 2003) are displayed. No updates for Microsoft Exchange Server 2003 although I know that some post SP2 hotfixes have been published. In particular, I don't see any updates for the intelligent message filter. The ContentFilterState value is set to 1 in HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Exchange.

It seems as Microsoft Windows Update doesn't detect the installed Exchange Server.

Any ideas?

Kind regards,
Dominik
