I am the admin of a small network. I have 22 users on my LAN and another 17 users over our WAN for a total of 39 users. All need to access new software that utilizes MS SQL server and all need access to e-mail. I was considering purchasing a new server with SBS 2003 premium to take advantage of SQL and Exchange. (Currently a 3rd party host our e-mail - POP) If I understand correctly, this machine will need to be my PDC. I had read that SQL server should not run on a PDC or BDC. I would assume that Microsoft would design the software to run well on such a small network, however I am obviously concerned about my dual 3Ghz / 2GB RAM/ 72GB RAID 5 server being underpowered even with so few users. Thanks.
