Well the 209 # is all internal IPs.. I really dont want to change my entire setup for a specific IP.. My outside IP is a static IP.. I purchased a block of 5.. If you are saying that my external NIC should be a 10# how will this affect my Mail server and my web server? The 67.40.86.110 is to my router which from there it goes out.. the 67.40.86.105 is the 1st static IP in my block.. This serves as an Exchange server and a WebServer.. This worked before.. Why would running the RAS wizard change anything?

The 209.180.158.1 Is a static IP on my server (an IP I assigned just because, no reason for this IP) This should have no effect on the outside connection because this IP see's no outside connection.. The 67.40.86.105 is also a static IP that was purchased through my ISP..

Maybe I am not explaining this correctly, this setup has worked now for about 2 years.. Now that I need to setup a VPN and run an outside connection to my server over the internet, I ran the RAS wizard and now this setup doesnt want to work.. Even if I changed my IPs to private ranges it still doesnt make any sense as to why it stopped working.. How would changing IPs to a private range have any affect? This is kicking my ass, I am going to try an uninstall of the 2nd NIC, let the system reinstall it and see where I go from there..

>-----Original Message-----

>This is never going to work. Why are you using public IP's on your nics?

>Better get the to the private ranges. Use static IP's on the nics.

>Internal nic should be something like:

>IP: 192.168.16.2

>GW blank

>DNS 192.168.16.2

>
