Hope someone can help. Been trying all day to get SBS 2k to see the router, (I initially stopped the ISA server) Keep running the Internet Connection Wizard, but after entering details I was then getting stuck at the section where you need to choose the Network Card for the internal Lan and the internet network card. It comes up saying that the network card IP is within the server ip addresses named in the LAT. So I eventually set the router and Nic card to 192.169.0.2 the router to 192.169.0.1. I then was able to get through that, eventually it said it was configuring. I then checked but nothing worked. Lost my original Modem (dial up) connection, now I have no internet connection or email!

Does anyone have any clear instructions for this please!

Basics of what I want:

SBS 2k running everything in the office (as normal), with a NIC card to a switch where all PC's are connected. I have added a second NIC card, which will connect to the Vigor 2600 router/ADSL Modem, and connect to adsl line.

Many thanks

Dave
