Ok, I was hoping to get some more information regarding VPN's. I have set up a VPN here at work with the SBS Server. A few of the sales personal take their laptop home with them and are able to login to the vpn and get a connection, but we are unable to gain access to the shared drives, etc. They are logging onto the VPN with their username, they are logging into our domain, they have a live connection but can't do any actual work with it? Any help with this would be appreciated. If I understand it correctly shouldn't they be able to gain access to the shared data directories, access their outlook (email) and basically work from home or abroad once they have logged into the vpn? Thank you for your help and time!
